Outer membrane.
SIMILARITY: BELONGS TO THE OMPC/PHOE FAMILY OF PORINS.
                                                                                                                                                                                                                                                                                                                                                                                                   van der Ley P., Bekkers A., van Meersbergen J., Tommassen J.;

A comparative study on the phoE genes of three enterobacterial
species. Implications for structure-function relationships in a
pore-forming protein of the outer membrane.";

Eur. J. Biochem. 164:469-475(1987).

-! FUNCTION: THIS IS ONE OF THE PROTEINS INDUCED WHEN CELLS ARE
GROWN UNDER PHOSPHATE LIMITATION. ITS PROTEIN PORE IS
PHOSPHORYLATED COMPOUNDS, AND SOME OTHER NEGATIVELY CHARGED
                                                                                                                                                                                                                                                                  Bacteria; Proteobacteria; gamma subdivision; Enterobacteriaceae;
Klebsiella.

-!- MISCELLANEOUS: A PORIN GENE CAN ALSO BE FOUND IN THE GENOMES OF CERTAIN LAMBDOID BACTERIOPHAGE, AND ITS PROTEIN IS EXPRESSED IN THE LYSOGENIC STATE. IN E.COLI THE EXPRESSION OF OMPC AND OMPF PROTEINS IS THEN REDUCED SUBSTANTIALLY.
-!- SIMILARITY: BELONGS TO THE OMPC/PHOE FAMILY OF PORINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 AEIYNKDGNKVDLYGKAVGLHYFSKGNGENSYGGNGDMTYARLGFKGETQINSDLTGYGQ

"Characterization of the Citrobacter freundii phoE gene and
development of C. freundii-specific oligonucleotides.";
FEMS Microbiol. Lett. 78:199-204 (1992).
-!- FUNCTION: THIS IS ONE OF THE PROTEINS INDUCED WHEN CELLS ARE
GROWN UNDER PHOSPHATE LIMITATION. ITS PROTEIN PORE IS
PARTICULARLY EFFICIENT IN THE UPTARE OF INORGANIC PHOSPHATE,
PHOSPHORYLATED COMPOUNDS, AND SOME OTHER NEGATIVELY CHARGED
Klebsiella oxytoca.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is that of synthetic coiled protein Recognin B1. The invention provides methods for purifying structural proteins, including spider slik proteins. Organic acids are used to lyse recombinant cells or other biological samples (such as non-recombinantly derived cells), and enrich the purity and yleids of structural proteins by hydrolysing many of the macromolecules of structural proteins intact. In the present case, while leaving the structural proteins intact. In the present case, Recognin B1 DNA was cloned into vector pQB-9 for recombinant protein was purified from lyophilised pellets using formic acid, acetic acid, propionic acid, butyric acid or valeric acid. Formic acid, acetic acid, propionic acid, butyric acid or valeric acid, were able to extract acids, but none of the other organic acids, were able to extract acids was able to extract Recognin B1 in a relatively pure form. The new method has the following advantages over prior art: it involves fewer steps, requires less time and smaller volumes of reagents, ceasits in better recovery of protein at higher purity (70-99%), is being solution reducing hazardous waste accumulation and cost.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Colled coll protein; copolymer blocker; vulnerary; wound treatment; integrin; fibroblast cell; matrix formation; skin regeneration; scaffold; antibiotic; dressing; abrasion; burn.

```
This invention describes a novel synthetic block copolymer XYZ comprising two alpha-helical protein blocks X and Z, a water soluble, random-coil two alpha-helical protein blocks X and Z, and inker proteins for linking the alpha-helical protein blocks to the random-coil protein block. The products of the invention have vulnerary activity. A copolymer produced from a gene that encodes a derivative of AC_1OA copolymer produced in water to form a gel, which was represed to treat a wound. The cell binding domain was the integrin ArgGlyAspSer sequence which is known to bind to gpila/IIIa proteins expressed on fibroblast secone centrapped within the gel and thus remain at the site of the wound, a synthetic block copolymer together with an antibiotic compound is useful for wound dressing. The copolymer is useful for dressing copolymer together with an antibiotic compound is useful for wound dressing. The copolymer is useful for dressing bolymers of equal size are produced biologically from a single template. The intermolecular binding of alpha helical blocks are monodisperse which gives a uniform pore size depending on the length of random-coil block. The new copolymer block protein L2-A which is used to illustrate the

This invention describes a novel synthetic block copolymer XYZ comprising two alpha-helical protein blocks X and Z, and linker proteins for linking the alpha-helical protein blocks to the random-coil protein block. The alpha-helical protein blocks to the random-coil protein block. The products of the invention have vulnerary activity. A copolymer produced from a gene that encodes a derivative of AC_1.0A copolymer produced in water to form a gel, which was then used to treat a wound. The cell binding domain was the integrin ArgolyAapSer sequence which is known to bind to gplia/Tia proteins expressed on fibroblast cells necessary for matrix formation for the regeneration of skin. Fibroblasts become entrapped within the gel and thus remain at the site of the wound, serving as a scaffold for the regeneration of tissue surrounding the wound. A synthetic block copolymer together with an antibiotic compound is useful for wound dressing. The copolymer to useful for dressing abrasion, burn or non-puncture wound. Unlike conventional polymers, the colymers of equal size are produced biologically from a single template. The intermolecular binding of alpha-helical blocks are monodisperse which gives a uniform pore size depending on the length of random-coil block. The new copolymers have low molecular weight hence have decreased viscosity solutions or gels under suitable conditions. This sequence represents a copolymer block protein L2-A which is used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä

AAW43024-28 represent recognition sequences obtained from the library of recognition sequenes coded for by AAV04943. This DNA sequence is recognition sequenes coded for by AAV04943. This DNA sequence is cobtained by reverse translation. The codons were chosen to maximise expression in Escherichia coil, and to introduce useful restriction for subsequent genetic manipulations. The DNA sequence use a "mixed slite" of approach at the first base of the codons for amino acids positions 5 and 7 of the heptad (see below). The formation of a self-assembling structural material is mediated by the artificial recognition sequences content in sequences. A method of producing a self-assembling protein-based structural material comprises mixing a multiplicity of 2 different artificial peptide sequences, designed so as to spontaneously heterodimerise. Both artificial peptides have a coiled-coil alpha helical secondary structure having at least 2 heptad units. The artificial peptides spontaneously heterodimerials designed for specific functions e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recognition sequence; self-assembling; protein-based structural material; spontaneous heterodimerisation; colled-coil alpha helix; selectively permeable membrane; coated fabric.
                                                                                                                                                                                                                                                                                                                                                                                                  membranes, fibres, absorbants, reactive materials, etc. A specific application is in the fabrication of selectively permeable membranes for protective gloves and coated fabrics for fuel handlers and other hazardous materials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hazardous măterials. Materials for medical implants, wound healants and other medical treatments would also be feasible using this technology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

expression in Excenting coll, and to introduce user, restriction, coll subsequent genetic manipulations. The DNA sequence use a "mixed site" approach at the first base of the codons for aniho acids positions 5 and coll the heptad (see below). The formation of a self-assembling structural material is mediated by the artificial recognition sequences of structural material comprises mixing a multiplicity of protein-based structural material comprises mixing a multiplicity of 2 different artificial peptide sequences, designed so as to spontaneously heterodimerise. Both artificial peptides spontaneously heterodimerise into a self-assembled coll alpha helical secondary structure having at least 2 heptad units. The artificial peptides spontaneously heterodimerise into a self-assembled protein-based structural material. The method is used to produce consocial structural materials designed for specific functions e.g. consocial structural materials designed for specific functions of protein-based structural materials designed for specific functions is in the fabrication of selectively permeable membranes for protective gloves and coated fabrics for fuel handlers and other coated fabrics for fuel handlers wound healants and other medical treatments would also be feasible using this technology.
                expression in Escherichia coli, and to introduce useful restriction for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Local

                                                  AAW43024-28 represent recognition sequences obtained from the library of recognition sequenes coded for by AAV04943. This DNA sequence is obtained by reverse translation. The codons were chosen to maximise expression in Escherichia coil, and to introduce useful restriction for subsequent genetic manipulations. The DNA sequence use a "mixed site" of approach at the first base of the codons for amino acids positions 5 and 7 of the heptad (see below). The formation of a self-assembling of structural material is mediated by the artificial recognition sequences (e.g. present sequence). A method of producing a self-assembling protein based structural material comprises mixing a multiplicity of 2 different artificial peptide sequences, designed so as to spontaneously heterodimerise. Both artificial peptides have a coiled-coil alpha helical secondary structure having at least 2 heptad units. The artificial peptides spontaneously heterodimerise into a self-assembled corrective associations as directural material. The method is used to produce nanoscale structural materials designed for specific functions e.g. membranes, fibres, absorbants, reactive meterials, etc. A specific corrective gloves and coated fabrics for fuel handlers and other hazardous materials of medical implants, wound healants and coated coated fabrics for fuel handlers wound cheat and coated coated fabrics for fuel handlers wound other companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence; self-assembling; protein-based structural material; heterodimerisation; coiled-coil alpha helix; permeable membrane; coated fabric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAW43024-28 represent recognition sequences obtained from the library of recognition sequence coded for by AAV04943. This DNA sequence is obtained by reverse translation. The codons were chosen to maximise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel synthetic block copolymer XYZ comprising two alpha-helical protein blocks X and Z, a water soluble, random-coil protein block Y which links X and Z, and linker proteins for linking the alpha-helical protein blocks to the random-coil protein block. The products of the invention have vulnerary activity. A copolymer produced from a gene that encodes a derivative of AC_l_0A copolymer was suspended

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                in water to form a gel, which was then used to treat a wound. The cell binding domain was the integrin ArgGlyAspSer sequence which is known to bind to gpIIIA/IIIa proteins expressed on fibroblast cells necessary for matrix formation for the regeneration of skin. Fibroblasts become contrapped within the gel and thus remain at the site of the wound, serving as a scaffold for the regeneration of tissue surrounding the wound. A synthetic block copolymer together with an antibiotic compound is useful for wound dressing. The copolymer is useful for dressing abrashon, burn or non-puncture wound. Unlike conventional polymers, the polymers of equal size are produced biologically from a single template. The intermolecular binding of alpha-helical blocks are monodisperse which city is a uniform pore size depending on the length of random-coil block. The new copolymers have low molecular weight hence have decreased viscosity solutions or gels under suitable conditions. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recognition sequence; self-assembling; protein-based structural material; spontaneous heterodimerisation; colled-coil alpha helix; selectively permeable membrane; coated fabric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAW43024-28 represent recognition sequences obtained from the library of recognition sequenes coded for by AAV04943. This DNA sequence is obtained by reverse translation. The codons were chosen to maximise expression in Escherichia coli, and to introduce useful restriction for subsequent genetic manipulations. The DNA sequence use a "mixed site" approach at the first base of the codons for amino acids positions 5 and 5 of the heptad (see below). The formation of a self-assembling structural material is mediated by the artificial recognition sequences (e.g. present sequence). A method of producing a self-assembling protein-based structural material comprises mixing a multiplicity of
                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Production of peptide hetero:dimer(s) - in the fabrication of self-assembling protein-based structural material(s)
                                                                                                                                                                                                                                                                                                                                                                           Length 42;

AAW43024-28 represent recognition sequences obtained from the library of recognition sequenes coded for by AAV04943. This DNA sequence is obtained by reverse translation. The codons were chosen to maximise expression in Escherichia coil, and to introduce useful restriction for subsequent genetic manipulations. The DNA sequence use a "mixed site" subsequent genetic manipulations. The DNA sequence use a "mixed site" of the first base of the codons for amino acids positions 5 and 7 of the heptad (see below). The formation of a self-assembling structural material is mediated by the artificial recognition sequences c. 7 of the heptad sequence. A method of producing a self-assembling protein-based structural material comprises mixing a multiplicity of 2 different artificial peptide sequences, designed so as to spontaneously heterodimerise. Both artificial peptides about artificial peptides spontaneously heterodimerise into a self-assembled artificial peptides spontaneously heterodimerise into a self-assembled protein-based structural material. The method is used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
2 different artificial peptide sequences, designed so as to spontaneously heterodimerise. Both artificial peptides have a coiled-coil alpha helical secondary structure having at least 2 heptad units. The artificial peptides spontaneously heterodimerise into a self-assembled protein-based structural material. The method is used to produce nanoscale structural materials designed for specific functions e.g. membranes, fibres, absorbants, reactive materials, etc. A specific application is in the fabrication of selectively permeable membranes for protective gjoves and coated fabrics for fuel handlers and other hazardous materials. Materials for medical implants, wound healants and other medical treatments would also be feasible using this technology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recognition sequence; self-assembling; protein-based structural material; spontaneous heterodimerisation; coiled-coil alpha helix; selectively permeable membrane; coated fabric.

This invention describes a novel synthetic block copolymer XYZ comprising two alpha-helical protein blocks X and Z, a water soluble, random-coil protein block Y which links X and Z, and linker proteins for linking the alpha-helical protein blocks to the random-coil protein block. The calpha-helical protein blocks to the random-coil protein block. The products of the invention have vulnerary activity. A copolymer produced from a gene that encodes a derivative of AC_1_OA copolymer produced in water to form a gel, which was then used to treat a wound. The cell bluding domain was the integrin ArgGlyAspSer sequence which is known to compute of gpila/Tila proteins expressed on fibroblast cells necessary for matrix formation for the regeneration of sine. Fibroblasts become carrix formation for the regeneration of sisse surrounding the cwound. A synthetic block copolymer remain at the site of the wound, cound dressing. The copolymer is useful for dressing compound is useful for wound dressing. The copolymer is useful for dressing compound companies of equal size are produced biologically from a single template. The intermolecular binding of alpha-helical blocks are monodisperse which calves a uniform pore size depending on the length of random-coil block.
                                                                                                                                                                                                              ö

                                                                                healants and
nanoscale structural materials designed for specific functions e.g. membranes, fibres, absorbants, reactive materials, etc. A specific application is in the fabrication of selectively permeable membranes for protective gloves and coated fabrics for fuel handlers and other hazardous materials. Materials for medical implants, wound healarts and other medical treatments would also be feasible using this technology.

heterodimerisation; coiled-coil alpha helix;
permeable membrane; coated fabric.
The new copolymers have low molecular weight hence have decreased viscosity solutions or gels under suitable conditions. This sequence represents the coiled coil protein Al which is used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is used to obtain an entire library of recognition sequences. The DNA sequence encoding the present sequence is obtained by reverse translation. The codons were chosen to maximize expression in Escherichia coli, and to introduce useful restriction for subsequent genetic manipulations. The DNA sequence use a "mixed site" approach at the first base of the codons for amino acids positions 5 and 7 of the heptad (see below). The formation of a self-assembling structural material is mediated by the artificial recognition sequences obtained from the present sequence. A method of producing a self-assembling protein-based structural material peptide sequences, designed so as to spontaneously content artificial peptide sequences, designed so as to spontaneously enterodimerise. Both artificial peptides have a colled-coil alpha helical secondary structure having at least 2 heptad units. The artificial peptides spontaneously heterodimerise into a self-assembled protein-based structural material. The method is used to produce nanoscale structural materials designed for specific functions e.g. membranes, fibres, absorbants, reactive materials, etc. A specific application is in the coated fabrics for fuel handlers and other mazardous materials. Materials for medical implants, wound healants and other medical treatments would selectively by.
                                                                                                                                                                                                                                                                                                                                                                          ö

The method comprises immobilishing a polypeptide to a physical support, contacting the immobilised polypeptide with a test sample which may contain an agent capable of modifying the immobilised polypeptide, contacting the immobilised polypeptide with a binding partner polypeptide, where association of both polypeptide is dependent on the modification of state of the immobilised polypeptide, and measuring the association the binding partner polypeptide. The the binding partner polypeptide to the immobilised polypeptide.
                                                                                                                                                                                             The specification describes a method for analysing a sample. The method comprises immobilising a polypeptide to a physical support, contacting the immobilised polypeptide with a test sample which may contain an
                                                                                                                                                                                                                                                                                                               agent capable of modifying the immobilised polypeptide, contacting the immobilised polypeptide with a binding partner polypeptide, where association of both polypeptide is dependent on the modification state of the immobilised polypeptide, and measuring the association of the binding partner polypeptide, and measuring the association of the binding partner polypeptide to the immobilised polypeptide. The polypeptides is support and methods can be used to analyse a sample to determine if modification of a polypeptide is taking place and to identify modulators of the modification. This is useful for monitoring the post-translational modification of proteins. ABB08364 of sepresent binding partners which have collect-coll structures, and may be used in the method of the invention to assay for thrombin activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Binding partner; protein modification; post-translational modification; modulator; colled-coil structure.
High throughput assay for monitoring modification of polypeptides and modulation of the modifications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for monitoring modification of polypeptides and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel protease substrate for detecting a target protease which comprises a polypeptide containing a high-affinity binding site (1) for binding to a support, a cleavage site (2) specific for the target protease, and a sequence of amino acids forming a stretched helix (3). The substrate is useful for measuring protease activities and in online screening assays for proteases or protease inhibitors, especially based on surface plasmon resonance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                online screening assays for proteases or protease inhibitors, comprises a polypeptide with a binding site, a cleavage site and a stretched
polypeptides, support and methods can be used to analyse a sample to determine if modification of a polypeptide is taking place and to identify modulators of the modification. This is useful for monitoring the post-translational modification of proteins. AAB08383-84 represent binding partners which are used, in the method of the invention, to assay for tobacco etch virus (TEV) protease activity.
                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

This invention describes a novel protease substrate for detecting a target protease which comprises a polypeptide containing a high-affinity binding site (1) for binding to a support, a cleavage site (2) specific for the target protease, and a sequence of amino acids forming a stretched helix (3). The substrate is useful for measuring protease activities and in online screening assays for proteases or protease inhibitors, especially based on surface plasmon resonance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protease substrate useful for measuring protease activities and in online screening assays for proteases or protease inhibitors, comprises a polypeptide with a binding site, a cleavage site and a stretched
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5 HHHHHHGSMAS----GDLKNKVAQLKRKVRSLKDKAAELKQEVSRLEN-----EIEDLK 54

Sequence 18, Application US/09329884

Patent No. 6342233

GENERAL INFORMATION:
APPLICANT: LIVIN, Randall T.
APPLICANT: Hodges, Robert S.
TITLE OF INVENTION: PSEUDOMONAS TREATMENT:
TITLE OF INVENTION: COMPOSITION AND METHOD:
FILE REFERENCE: 8900-0008.30
CURRENT APPLICATION NUMBER: US/09/329,884

CURRENT PILING DATE: 1999-06-11
EARLIER RPPLICATION NUMBER: US 60/089,155
EARLIER PILING DATE: 1998-06-12

NUMBER OF SEQ ID NOS: 22

SOFTWARE: FSELEG for Windows Version 3.0

SEQ ID NO 18

LENGTH: 175

TENGTH: 175
               APPLICANT: Koeplinger, Kenneth A.
TITLE OF INVENTION: Method for Autoactivation
TITLE REFERENCE: Docket No. 6303239 6172.N CP
CURRENT APPLICATION NUMBER: US/09/360,017
CURRENT FILING DATE: 1999-07-23
SOFTWARE: Patentin Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 20, Application US/09329884

Patent No. US20020164337al

GENERAL INFORMATION:

TITLE OF INVENTION: MONOCLONAL ANTIBODIES TO THE MAP PROTEIN AND METHOD OF USE IN

TITLE OF INVENTION: AND PREVENTING INFECTIONS

FILE REFERENCE: P06922US02/ABS

CURRENT APPLICATION NUMBER: 08/09/982,992A

CURRENT APPLICATION NUMBER: 60/277,287

PRIOR FILING DATE: 2001-03-21

PRIOR FILING DATE: 2001-03-21

PRIOR FILING DATE: 2001-03-20

NUMBER OF SEQ ID NOS: 6

SOFTWARE: Patentin version 3.0

SEQ ID NO 2

LENGTH: 131

The rad50/mrell complex possesses single-strand endonuclease activity and ATP-dependent double-strand-specific exonuclease activity. Rad50 provides an ATP-dependent control of mrell by unwinding and/or repositioning DNA ends into the mrell active site.
-i- SUBGNIT: Forms a complex with mrell.
                                                                                                                                                     Archaea; Euryarchaeota; Thermococci; Thermococcales; Thermococcaceae;

MEWOLUTION of the hemagglutinin of equine H3 influenza viruses.";
Virology 169:283-292(1989).
- I- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS TO CELL RECEPTORS AND FOR INITIATING INFECTION.
- I- SUBBUNT: HOMOTRAIMER, EACH OF THE MONOMERS IS FORMED BY TWO CHAINS (HA1 AND HA2) LINKED BY A DISULFIDE BOND.
- I- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.
